

Our Bio-Lawn Fertilizer

503-910-5215

No Phosphates!

Our most popular program

Most store bought fertilizers have 3 or 4 ingredients while ours has over **Thirteen!** **Organic fulvic acid and organic microbes are added**, to re-establish biological activity in the soil. This creates an environment providing more nutrients to the lawn. Microbes also convert organic matter into nutrients and minimize thatch build-up.

No Smelly Odor!

Our bio-fertilizer contains no organic products that would be socially objectionable, like smelly compost or manures. The high analysis organic additives in our bio-fertilizer leave no offensive odors. Since iron (ferrous sulfate, like you find in good vitamins) is key to plant health, we add it to all our treatments. Iron does have a slight metallic odor but only for short time.

Liquid treatments

Since all our treatments (except lime) are liquid, there are no particles scattered about on hard surfaces or ornamental beds. Our unique delivery system allows us to inject control products right on the spot where they are needed. For example, a lawn that only has a few weeds will not be **blanket*** sprayed with herbicide; weeds will be treated individually. This practice eliminates **blanket*** application of control products.

* Blanket spray is to cover an entire lawn with a pesticide. Since most lawns have few weeds, blanket spraying is not environmentally sound. Spot spraying is the better choice.

Safer for the environment!
